

Preemie Transport Blanket

Bionix Preemie Transport Blanket is specifically designed to safely transfer infants to the NICU while maintaining core internal temperature and providing direct access to the torso when immediate care is required.

► PROBLEM:

Hypothermia at birth is independently associated with higher mortality rates for neonates and VLBW infants. These infants lack the ability to effectively control thermal homeostasis.

► SOLUTION:

The Preemie Transport Blanket reduces evaporative heat loss in premature and very low birth weight infants. The unique design provides easy access to the torso when immediate care is required.

► RESULTS:

A versatile blanket designed to effectively help thermoregulate your most delicate patients.
